I'd like to use a regex in order to get a group of lines (containing all data) that correspond to one object. My current regex is: (?:)(?:)(.*?)(?=(?:\|)) it matches every data i need but i need to clean them in order to get a single match for an object. the subject is an array with length >0. for example i get: what i expect is to get the table. and maybe remove table from the subject. Any ideas? A: Regex isn't the best for this task. Get the lines using the String API, then use a regular expression on each one. Something like: @"(?:\w+),\s*\s*.*?\s*.*?" To serve this purpose, a user must only visit the web site they wish to redirect through the same browser (Internet Explorer, Netscape, or other WWW browsers). As I have seen, there are many drawbacks in using this method. Where can I find such a tool with a GUI? A: This is the script that you are looking for. I have not tested it though. Please let me know if this works.

We fail to see how its motives were relevant. It does not follow that the I.R.S. investigation was undertaken in bad faith, as this court characterized that investigation in *Fisher v. United States*, 572 F.2d 181, 192-93 (3d Cir. 1978).³ 13 We conclude that we have no jurisdiction over the appeal from the order of the district court of December 5, 1977, from which this appeal was taken, because the notice of appeal was not filed within the time prescribed by Rule 4(a) of the Federal Rules of Appellate Procedure. The appeal from the order of November 14, 1977, was filed within the thirty-day period required by Rule 4(a). In addition, the order of November 14, 1977, is appealable. In re *United States Steel*, 519 F.2d 1248 (3d Cir. 1975). Since we thus have jurisdiction to decide this appeal, we need not decide whether other provisions in the statute of limitations, such as 26 U.S.C. § 7422, would also bar this appeal.
