1. Field of the Invention The present invention relates to an X-ray computed tomography (CT) apparatus, and more particularly to an X-ray CT apparatus, in which an X-ray beam having a relatively small energy is applied to a region of an object to be examined, for the purpose of obtaining an X-ray absorption coefficient μ/ρ (unit-radius absorption coefficient $\mu\text{-1/grams/cm-2}$) of the object.

2. Description of the Related Art According to the invention disclosed in Japanese Unexamined Patent Publication No. 6-301254, it is possible to clarify the absorption of X-rays, relative to the material of a sample. As a result, it is possible to determine the composition of the sample. Further, as described in Japanese Unexamined Patent Publication No. 6-301254, according to the invention disclosed in Japanese Unexamined Patent Publication No. 6-301254, it is possible to obtain the size distribution of a particle in an analysis of a sample, by measuring the absorption of X-rays of the sample. According to the invention disclosed in Japanese Unexamined Patent Publication No. 10-224430, an X-ray beam of an energy level below the K-edge can be applied to a region of an object to be examined, to obtain an X-ray absorption coefficient of the object. According to the invention disclosed in Japanese Unexamined Patent Publication No. 11-208048, a small region of an object to be examined can be examined, using a wide energy range X-ray beam, to obtain an X-ray absorption coefficient μ/ρ (unit-radius absorption coefficient $\mu\text{-1/grams/cm-2}$) of the object, from an X-ray absorption spectrum of the object. According to the invention disclosed in Japanese Unexamined Patent Publication No. 11-208048, the object is a thin plate-like sample, having a thickness of several mm, for example. Accordingly, if the object is applied to a detector, it is necessary to use a detector which is sufficiently wide in the direction of an X-ray beam, in order to obtain a correct X-ray absorption coefficient. Further, if the X-ray beam is applied to a region of the object where the thickness thereof is extremely small, it becomes necessary to accurately control the thickness of the sample to be applied to the detector. Accordingly, the invention
