

Closed shape curve suitable for water content functions. ... 151. Summary. ... come into play when calculating the basic shear force, but the water force per se. ... We cannot imagine that there is any form of body that could provide protection against the forces of water. When moving diagonally down the body, water flows along a straight line, and as a result, the force that acts on the entire surface of this body is zero. At point A in Figure 152. a, water acts in a straight line from the bottom to the surface. Here we have a force equal to zero. At point B (Fig. 152.c) the surface has a convexity, hence the force acting on it is zero.
